SupportPro – Sample Product Manual

Important note: This is a fictional sample manual created for practicing the Week 4 RAG Assistant assessment. It is not a manual supplied by a trainer or an actual commercial product.

1. Product Overview

SupportPro is a fictional customer-support platform for managing customer requests, tracking orders, and helping support agents resolve common issues. The platform includes a web dashboard, customer profiles, ticket management, order lookup, and notification settings.

The dashboard is available to users with an active SupportPro account. Users should sign in with their registered email address and password. A user who forgets a password can select “Forgot password” on the sign-in page and follow the reset link sent to the registered email address.

2. Plans and Account Access

SupportPro offers three fictional plans: Starter, Professional, and Enterprise. The Starter plan supports up to 3 team members. The Professional plan supports up to 20 team members. The Enterprise plan supports up to 100 team members.

A plan administrator can view the current plan in Settings → Subscription. Only users with the Administrator role can change subscription settings. Team members without the Administrator role can view their profile but cannot change billing details or upgrade the plan.

3. Ticket Management

To create a support ticket, open the Tickets page and select New Ticket. Enter a short subject, describe the issue, choose a category, and select Submit. The available categories are Billing, Technical, and Account. After submission, SupportPro assigns a ticket number.

Ticket priority can be set to Low, Normal, High, or Urgent. Use Urgent only when a critical service is unavailable for multiple users. Agents can add internal notes that are visible only to support staff. Replies marked as Public are visible to the customer.

The ticket status values are Open, In Progress, Waiting for Customer, and Closed. An agent can change the status from the ticket details page. Closing a ticket does not delete its history; closed tickets remain searchable.

4. Order Lookup

To find an order, open the Orders page and enter the complete order ID in the search box. Select Search to display the order record. The order record may show the order date, items, payment state, shipping state, and delivery address.

The order statuses used in this sample system are Processing, Shipped, Delivered, and Cancelled. Processing means the order has been received but has not yet shipped. Shipped means the package has left the warehouse. Delivered means the carrier has marked the package as delivered. Cancelled means the order will not be fulfilled.

5. Payments and Billing

Billing administrators can open Settings → Billing to view invoices and payment history. An invoice is generated at the start of each subscription period. The invoice includes the plan name, billing period, subtotal, applicable tax, and total amount.

If a payment fails, check that the payment method has not expired and that the billing address is correct. The administrator can update the payment method from Settings → Billing → Payment Method, then select Retry Payment. SupportPro does not store the full payment-card number in the account profile.

For a duplicate charge, do not submit repeated payment attempts. Record the invoice number and transaction date, then contact the billing support team for investigation. Refund eligibility and processing time are not specified in this sample manual.

6. Notifications and Troubleshooting

Users can manage email notifications from Profile → Notification Preferences. Available notification types include ticket updates, order status changes, and subscription reminders. Turn a notification type on or off using its toggle, then select Save.

If the dashboard does not load, refresh the browser and check the internet connection. If the problem continues, sign out and sign in again. If the user still cannot access the dashboard, create a Technical ticket and include the browser name, operating system, approximate time of the issue, and any displayed error message.

7. Security and Support

Never share your password or one-time verification code with another person. SupportPro support agents will not ask customers to send their password by email. Sign out when using a shared computer.

For account access problems, use the password-reset process first. For suspected unauthorized access, contact the account administrator and request that the account password be changed. The administrator should review the account's recent activity.

8. Information Not Covered

This sample manual does not define mobile-app compatibility, exact service uptime, refund timelines, supported payment currencies, data-retention periods, or a telephone support number. If asked about these details, an assistant using this manual should say: “I don't know.”
